Your viewpoint exposure report

Topic: gender and relationships · last 30 days · MOCK-UP, example user

1 How much of your feed is this topic

46 of 2,200 videos (2.1%). Typical user: 1.6%.

Watching a lot of one topic is interest, not a cocoon. Part 2 is about what you see within it.

2 Within the topic: are you seeing one side more?

Compared with the same topic in the non-personalised feed.

Any opposing narrative

Not enough evidence yet

To tell a 2x difference from chance needs about 196 videos on this topic;

you have seen 46 (23.5% of what is needed).

Group labels

Not enough evidence yet

To tell a 2x difference from chance needs about 6,475 videos on this topic;

you have seen 46 (0.7% of what is needed).

We show a verdict only when the evidence is sufficient. For most users and rare narratives it never is.

3 What you can do, and what it may cost

Expected change in this narrative's share vs doing nothing (simulation, not measured on the app).

	effect	topic kept
Delete these videos from my history *lasts after you stop; needs accurate labels*	large	99%
Hide these videos (filter) *works only while on; keeps 86% with a weaker classifier*	large	95%
"Not interested", if it acts as negative feedback *depends on how the platform uses it*	medium	99%
"Not interested", if it behaves as in our OneRec test *may not help at all*	little or none	100%
Turn off personalisation *removes only the personal layer*	small	99%
Skip these videos quickly	small	99%
Watch other videos on the topic to the end *ordinary videos barely offset it*	little or none	100%

Leave the topic entirely: the narrative disappears, and so does everything else on the topic.

4 What this report does not say

- It does not judge which view is right, or label any view as harmful.
- It does not infer what you believe; it describes only what you were shown.
- It does not claim the platform intends any pattern.
- Comparing with the non-personalised feed shows only your personal layer; a skew built into the platform's overall ranking would not appear here.
- Labels come from a language model and can be wrong.
